

MASSIVE PARALLEL METHOD FOR DECODING DNA AND RNA

Abstract of the Disclosure

5 This invention provides methods for attaching a nucleic
acid to a solid surface and for sequencing nucleic acid
by detecting the identity of each nucleotide analogue
after the nucleotide analogue is incorporated into a
growing strand of DNA in a polymerase reaction. The
10 invention also provides nucleotide analogues which
comprise unique labels attached to the nucleotide
analogue through a cleavable linker, and a cleavable
chemical group to cap the -OH group at the 3'-position
of the deoxyribose.
